PROMPTS:

Master Prompt 1 — Find Long-Form AI Video Topics

You are a YouTube topic strategist specialized in long-form AI-generated videos.

Your job is to find topics that can become engaging videos longer than ten minutes, created only with AI-generated images, AI video clips, AI narration, and AI background music.

The topics must be visually strong, cinematic, emotional, mysterious, or educational. They must work without screen recordings, without real footage, without interviews, and without showing software tutorials.

Optional niche or topic:

[WRITE A SPECIFIC NICHE HERE, OR LEAVE THIS BLANK]

Target video language:

[WRITE THE LANGUAGE OF THE FINAL VIDEO HERE]

Target audience:

General YouTube viewers who enjoy cinematic documentaries, mysteries, history, science, survival stories, ancient civilizations, space, deep ocean, myths, strange creatures, lost places, future scenarios, or emotionally powerful stories.

Important rules:

- If I leave the niche blank, explore broad topics with high visual and storytelling potential.
- If I write a niche, stay inside that niche but look for the strongest angles.
- Prioritize topics that feel clickable, cinematic, and easy to turn into AI-generated clips.
- Avoid topics that require screen recordings, software tutorials, app walkthroughs, exact real footage, celebrity likenesses, current news footage, copyrighted characters, or real private people.
- Do not suggest basic “how to install” or “how to use an app” topics.
- Good topic types include ancient empires, lost civilizations, mysterious historical events, cosmic horror, strange scientific theories, deep ocean mysteries, survival

stories, mythology, future collapse scenarios, unknown creatures, forgotten disasters, and dramatic educational stories.

- If the topic is factual, keep it accurate and do not invent fake facts.
- If the topic is fictional, mythological, or speculative, make that clear in the concept.
- Use live research if you have access to it. If you do not have live browsing, do not pretend you verified current numbers. Instead, use YouTube demand logic, evergreen curiosity, visual potential, and competition reasoning.

Give me 10 topic opportunities.

For each topic, include:

1. Topic name
2. Possible YouTube title
3. One-sentence hook
4. Why this topic could get views
5. Why it may have less competition than obvious topics
6. Why it works well for AI-generated visuals
7. The emotional angle of the video
8. The first 25-second trailer angle
9. Five powerful visual moments that could appear in the video
10. Risk to avoid so the video does not become low-value or generic
11. Video type: factual documentary, speculative documentary, fictional story, mythology, history, science mystery, or cinematic explainer
12. Copy-ready selection for the next prompt

The copy-ready selection must include the full idea, the angle, the audience, the promise, the tone, the visual style, and any important warnings.

Format each result like this:

TOPIC 1: [Topic Name]

Possible title:

[Title]

Hook:

[Hook]

Why it could work:

[Reason]

Competition gap:

[Reason]

AI visual potential:

[Reason]

Emotional angle:

[Angle]

First 25-second trailer angle:

[Trailer angle]

Five powerful visual moments:

1. [Moment]
2. [Moment]
3. [Moment]
4. [Moment]
5. [Moment]

Risk to avoid:

[Risk]

Video type:

[Type]

COPY THIS SELECTION TO THE SECOND MASTER PROMPT:

[Complete topic selection]

After giving me the 10 topics, tell me to choose the topic that gets my attention the most and copy its full selection into the second master prompt.

Master Prompt 2 — Build the Long-Form Video Structure

You are a long-form AI video architect.

Your job is to turn one selected topic into a complete structure for a long-form video that can be created with AI-generated images, AI video clips, AI narration, and AI background music.

This must match a workflow where:

1. I paste a selected topic.
2. You give me several strong video ideas inside that topic.
3. You wait for me to choose one idea.
4. After I choose, you generate the full video structure divided into blocks.
5. Each block must include a narration line of around five seconds, an image prompt, and a video prompt.
6. Before the blocks, you must give me a voice description for Qwen3-TTS and a song description for Sonauto.

Do not generate the full block structure in your first answer. First, give me video ideas and ask me which one I choose.

VIDEO LENGTH I WANT:

[WRITE THE APPROXIMATE LENGTH HERE, FOR EXAMPLE: 10 minutes]

FINAL VIDEO LANGUAGE:

[WRITE THE LANGUAGE FOR THE NARRATION HERE, FOR EXAMPLE: English]

VIDEO FORMAT:

[WRITE HORIZONTAL 16:9 OR VERTICAL 9:16. DEFAULT: HORIZONTAL 16:9]

SELECTED TOPIC FROM THE FIRST PROMPT:

[PASTE THE FULL SELECTED TOPIC HERE]

First response instructions:

Give me 6 different video ideas based on the selected topic.

Each idea must include:

1. Working title
2. Core promise
3. Why someone would click
4. The first 25-second hook or trailer
5. The emotional tone
6. The visual style
7. What makes it different from generic AI content
8. Whether it is factual, speculative, fictional, mythological, or educational

The ideas must be visually powerful and suitable for AI video generation. Avoid ideas that depend on screen recordings, UI tutorials, real-world interviews, real footage, or copyrighted characters.

After giving the 6 ideas, stop and ask me this exact question:

“Which idea do you choose, and what final video length do you want?”

Do not continue until I answer.

When I answer with the chosen idea and final length, generate the full production structure using the rules below.

FULL STRUCTURE RULES:

The final output must include these sections, in this exact order:

1. FINAL VIDEO TITLE
2. CENTRAL PROMISE OF THE VIDEO
3. TONE OF THE VIDEO
4. VOICE DESCRIPTION FOR QWEN3-TTS
5. SONG DESCRIPTION FOR SONAUTO
6. VISUAL STYLE RULES
7. FULL BLOCK-BY-BLOCK STRUCTURE

The voice description must be a single paragraph ready to paste into Qwen3-TTS Voice Design. It must describe the narrator's voice, pacing, emotion, age range, energy, clarity, and delivery style. It must match the topic. For example, a cosmic mystery should sound cinematic, calm, tense, and mysterious. A historical empire story should sound authoritative, dramatic, and documentary-like. Do not mention celebrity voices.

The song description must be a single paragraph ready to paste into Sonauto Simple. It must describe the background music style, mood, instruments, energy, pacing, and emotional progression. It must be instrumental, cinematic, and without vocals or lyrics unless I specifically ask for vocals. It must fit the video we are creating.

The visual style rules must tell the image and video generators how the whole video should look. Include aspect ratio, realism level, lighting style, color palette, cinematic style, camera language, and things to avoid. Always avoid text, subtitles, logos, watermarks, UI elements, distorted faces, extra limbs, unreadable signs, and copyrighted characters.

BLOCK STRUCTURE RULES:

Each block equals around five seconds of final video.

Calculate the number of blocks based on the final duration:

- 1 minute = 12 blocks
- 5 minutes = 60 blocks
- 10 minutes = 120 blocks
- 12 minutes = 144 blocks
- 15 minutes = 180 blocks

If the full answer is too long for one response, generate the blocks in batches of 30. Stop only after a complete block and tell me to reply "CONTINUE" for the next batch. Do not summarize or skip blocks.

The first 20 to 25 seconds must be extremely strong. That means the first 4 or 5 blocks must feel like a cinematic trailer. They must create tension, curiosity, and a reason to keep watching. Do not start with a normal introduction. Do not say "In this video." Do not explain everything immediately. Start with the most visual, mysterious, emotional, or shocking moment, then create an unanswered question.

The first 5 blocks must:

- feel like a trailer
- create tension
- show the biggest visual promise of the video
- make the viewer curious
- avoid generic explanations
- avoid boring context
- avoid giving away the full answer too early

After the first 5 blocks, the video can begin the full story or explanation, but it must keep moving forward. Every block must add a new detail, reveal, image, question, consequence, or emotional beat.

Each block must use this format:

BLOCK 001

Narration:

[One spoken narration line, around five seconds long, in the final video language.]

Image prompt:

[One detailed English prompt for generating the image. It must describe the subject, scene, composition, lighting, mood, camera angle, visual style, aspect ratio, and important details. It must not include text, logos, subtitles, watermarks, UI elements, or copyrighted characters.]

Video prompt:

[One detailed English prompt for animating that image into a five-second video clip. It must describe camera movement, subject movement, atmosphere, pacing, and emotion. It must be suitable for image-to-video or custom animation. It must not ask for text, logos, subtitles, watermarks, UI elements, or anything that requires real footage.]

Narration rules:

- The narration must sound human, cinematic, and natural.
- Each narration line must be short enough to fit around five seconds.
- Do not make every line the same length.
- Do not use filler.
- Do not repeat the same idea in different words.
- Do not write robotic documentary clichés.
- Do not overuse phrases like “but what happened next,” “the truth is,” or “what nobody knew.”
- Use curiosity, contrast, and progression.
- If the video is factual, keep facts accurate.
- If the video is fictional or speculative, do not present it as proven reality.
- If something is uncertain, phrase it as a theory, legend, possibility, or mystery.

Image prompt rules:

- Write all image prompts in English, even if the narration is in another language.
- Make every image prompt cinematic and visually specific.
- Every image should feel like part of the same video, but not repetitive.
- Vary the scale: wide shots, close-ups, aerial views, details, landscapes, characters, objects, environments, symbols, and dramatic moments.
- Avoid boring talking-head visuals unless the topic truly needs them.
- Avoid modern UI screens, screenshots, phones, laptop screens, or software interfaces.
- Make the image easy for AI to generate.

Video prompt rules:

- Write all video prompts in English.
- Each video prompt must animate the image naturally.
- Include camera movement such as slow push-in, orbit, tracking shot, aerial drift, handheld tension, crane movement, or slow zoom when appropriate.
- Include environmental motion such as dust, fog, fire, stars, rain, waves, smoke, wind, shadows, or light movement when appropriate.

- Do not ask for complex actions that AI video models are likely to fail at.
- Keep movements clear and cinematic.
- Make the clip feel publishable, not chaotic.

Retention rules:

- Every 4 to 6 blocks, introduce a new visual beat or story shift.
- Do not stay too long in the same place visually.
- Keep the viewer moving through scale, mystery, consequence, discovery, conflict, and payoff.
- Build a clear beginning, middle, and ending.
- The final blocks must give closure, not just stop randomly.
- The ending should feel satisfying, cinematic, and complete.

Important:

The final result must be practical for creating AI videos. Do not write a script that would require real footage, interviews, screen recordings, exact news clips, celebrities, copyrighted characters, or UI demonstrations.

Now read the selected topic and give me the 6 video ideas first. Then stop and wait for my choice.

Deep Space Galaxy Image Prompt

A breathtaking cinematic view of deep space, showing a vast spiral galaxy glowing in blue, violet, and cold white tones, surrounded by dense star fields, cosmic dust, distant nebulae, and faint celestial light. In the far darkness, subtly suggest the presence of something unknown and threatening hidden beyond the visible stars, without clearly revealing it. The scene should feel immense, mysterious, silent, and slightly unsettling, with dramatic contrast, rich detail, and a premium sci-fi documentary look. Ultra cinematic composition, epic scale, atmospheric lighting, realistic space textures, sharp focus, no text, no logos, no watermark, 16:9.

Cosmic Horror Trailer Video Prompt

Use the provided galaxy image as the start frame.

Create a 15-second ultra-cinematic sci-fi trailer with multiple scenes, multiple camera changes, and strong visual escalation. The trailer must feel intense, mysterious, and highly intriguing, like the opening of a premium documentary about a terrifying theory hidden in the universe. No narrator, no dialogue, no subtitles, no text on screen.

Scene flow:

Start with a slow cinematic push through the galaxy from the start frame, with stars drifting and deep space ambience. Then transition into a wider cosmic view showing vast empty space and distant galaxies. Cut to a faint artificial signal pulse traveling across the darkness. Cut to a lonely planet in space, partially illuminated, as if being watched. Cut to a giant shadowy unknown form or anomaly barely visible in the void, never fully revealed, only suggested through scale and silhouette. Cut to Earth seen from space with subtle tension,

as if humanity is unknowingly exposed. Cut to a deep-space observatory or distant alien structure suddenly going dark. End with a dramatic pull back into the enormous silent universe, leaving the threat unresolved.

Style:

Very dynamic pacing, multi-scene, multi-angle, cinematic trailer energy, premium sci-fi documentary feel, dark cosmic horror atmosphere, huge scale, mysterious and unsettling.

Camera:

Slow push-ins, fast cinematic cuts, wide establishing shots, orbital movement, drifting aerial motion, subtle zooms, dramatic pull-back at the end.

Motion and atmosphere:

Moving stars, nebula drift, faint signal pulses, cosmic dust, subtle light flicker, shadow movement, planetary rotation, environmental depth, suspenseful visual rhythm.

Audio:

Include powerful cinematic trailer audio with deep space ambience, dark drones, low sub-bass rumbles, rising tension, glitchy signal pulses, distant impacts, reversed textures, and a strong dramatic climax near the end. No vocals, no speech, no lyrics.

Important:

Make the first 5 seconds instantly gripping. Every shot must feel visually stronger than the previous one. Focus on mystery, tension, cosmic scale, and the feeling that something unknown is hiding in the universe.

SUMMARY:

This video explains a complete free workflow for creating long-form AI videos longer than ten minutes using AI-generated images, AI video clips, AI narration, and AI background music. The key idea is that YouTube can still reward AI-made videos if they provide real value, entertainment, or education instead of feeling like low-effort AI slop.

The workflow starts with **ChatGPT** or another free text AI. The first master prompt helps the user find strong long-form video topics with cinematic potential. The user can either write a specific niche or leave the field blank to let the AI suggest broad topics with high storytelling potential.

After choosing one topic, the user copies the full selection into the second master prompt. This prompt first gives six possible video ideas inside that topic and waits for the user to choose one. After the user chooses the idea and final length, it creates a full structure divided into blocks. Each block includes one short narration line, one image prompt, and one video prompt.

The structure is designed for long-form production. A ten-minute video equals around 120 blocks, because each block represents about five seconds. The first four or five blocks are designed like a trailer so the video starts with tension, mystery, and strong visual promise instead of a boring introduction.

Once the structure is ready, the user creates all the images inside **Meta AI**. The recommended workflow is to start a new chat, use Create Image, copy each block's image prompt, and generate four image variations. This gives enough options to choose the strongest frame before animation.

After the images are ready, the user turns them into video clips using **Meta AI Custom Animate**. For each image, the user copies the matching video prompt from the same block and pastes it into Custom Animate. This turns each still image into a short animated clip. If a clip comes out wrong, the user can regenerate it because the workflow is free and unlimited.

The script also explains a Meta download workaround. Downloading directly from the normal place can cause problems, so the user opens the generated video, uses the browser option shown in the tutorial, copies the selected video URL, opens it in a new tab, and downloads it from there.

For narration, the workflow uses **Pinokio** with **Qwen3-TTS**. The user installs Pinokio, searches for Qwen3-TTS, installs the Featured version, downloads the required models, and creates the narrator using Voice Design, Voice Clone, or Custom Voice. The voice description generated by the second master prompt can be pasted into Voice Design to match the tone of the video.

For music, the workflow uses **Sonauto**. The second master prompt creates a background song description, which the user pastes into Sonauto Simple to generate cinematic music. The song is then downloaded and added to the final edit.

The final assembly happens in **CapCut**. The user imports all Meta AI clips in order, adds the narration, adjusts each clip speed so it matches the corresponding narration line, places the Sonauto background music underneath, and uses free transitions or effects when needed.

The final takeaway is that the video is not just about generating random AI clips. The system creates a long-form topic, structure, images, video clips, voiceover, music, and final edit using free tools, while keeping the video valuable enough to avoid looking like generic AI content.

COMMON ERRORS:

Starting without a strong topic

Do not start generating images before choosing a topic with real long-form potential. The first master prompt exists to help find topics that are clickable, cinematic, and worth watching for more than ten minutes.

Choosing topics that require real footage

Avoid topics that depend on interviews, current news clips, screen recordings, software walkthroughs, celebrity likenesses, or exact real footage. These are harder to make with AI and can make the project weak or risky.

Forgetting to set the language and format

Before using the prompts, fill in the final video language and format. If you want a horizontal YouTube video, use 16:9 from the beginning.

Generating the full structure too early

The second master prompt should first give six video ideas. Choose one idea first, then ask for the full block-by-block structure.

Ignoring the first 25 seconds

The first 4 or 5 blocks should feel like a trailer. Do not start with a slow explanation or “In this video.” Start with the strongest visual mystery or emotional question.

Losing the block order

Each block has a narration line, image prompt, and video prompt. Keep them in order, because the final edit depends on matching each clip to the correct narration.

Generating only one image per block

Use Meta AI to generate multiple image variations when possible. Choose the best one before animating.

Animating weak images

Do not animate an image just because it was generated. If the image does not look strong, regenerate it first.

Using regular animation instead of Custom Animate

For better control, use Custom Animate and paste the video prompt from the matching block. This gives a clearer result than random animation.

Downloading Meta videos from the wrong place

If the normal download creates a problem, use the download method shown in the tutorial: open the video, inspect/select the correct video source, open it in a new tab, and download it from there.

Not regenerating bad clips

If a video clip looks wrong, regenerate it. The workflow is built around free tools, so use that advantage to improve weak parts.

Expecting one clip to cover too much

Each clip is around five seconds. Do not force a complex story into one animation prompt. Keep every visual beat simple and clear.

Making every shot look the same

Vary the visuals: wide shots, close-ups, details, landscapes, objects, symbols, and dramatic moments. A long video becomes boring if every clip feels identical.

Using factual topics without accuracy

If the video is factual, do not invent fake facts. Keep uncertain ideas framed as theories, legends, possibilities, or mysteries.

Creating narration that is too long for the clips

Each narration line should fit around five seconds. If the audio is too long, either shorten the line or adjust the clip timing in CapCut.

Trying to generate the full narration in one huge file

With local TTS tools, long narration may need to be generated in parts. Create manageable audio sections and keep them organized.

Skipping the Qwen3-TTS voice description

Use the voice description generated by the prompt. It helps the narration match the tone of the video instead of sounding random.

Using music that fights the narration

The background music should support the story, not distract from it. Keep it cinematic and instrumental unless vocals are specifically needed.

Forgetting to lower the music volume

In CapCut, place the music under the narration and make sure the voice stays clear.

Using paid CapCut effects by mistake

Use transitions and effects without the diamond icon if you want the workflow to stay fully free.

Leaving the final edit feeling like AI slop

The goal is not just to generate many clips. The final video needs structure, pacing, narration, music, and value. Without those, even good AI visuals can feel low-effort.
